The Translation Classroom: Technology, Strategies and Employability

Working with Corpora in the Translation Classroom

Ralph Krüger M.A.

PhD Student in Translation Studies

Cologne University of Applied Sciences/University of Salford

Some definitions of the term “corpus”

- „corpus now means primarily a collection of texts held in machine-readable form and capable of being analysed automatically or semi-automatically in a variety of ways ...“ (Baker 1995:225)
- “a corpus is by default assumed to be a collection of texts in electronic format which are processed and analyzed using software specifically created for linguistic research.” (Zanettin 2012:7).
- “A corpus can be described as a large collection of authentic texts that have been gathered in electronic form according to a specific set of criteria.” (Bowker and Pearson 2002:9)

Corpus typology in translation studies

- Parallel/translation corpora
 - consist of a set of texts in one language and their translations
 - may be bilingual or multilingual (e.g. translations into different languages)

- Comparable corpora
 - consist of comparable (original or translated) texts (usually the same genre, text type, register, subject matter, etc.)
 - may be monolingual, bilingual or multilingual
 - no translational relation between the corpus texts

Dichotomies in corpus linguistics/corpus-based translation studies

- general reference corpus vs. special purpose corpus
- written vs. spoken corpus
- monolingual vs. multilingual corpus
- permanent vs. disposable corpus
- synchronic vs. diachronic corpus
- open vs. closed corpus

Corpus types with direct relevance to translation teaching and practice

- Bilingual parallel/translation corpora (SL and TL texts)
 - insights into strategies employed by (professional) translators
 - provide more collocational and stylistic information than bilingual dictionaries
 - can be used to identify terminological equivalents and their collocates

- Monolingual comparable corpora (original TL texts)
 - checking terminology and collocates against original TL texts
 - searching for unknown equivalents and collocates
 - identifying genre conventions and register
 - searching for explanatory contexts (conceptual instead of linguistic information)

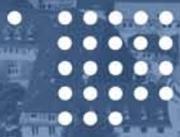

Situating the use of corpora in the translation process

overall translation project process

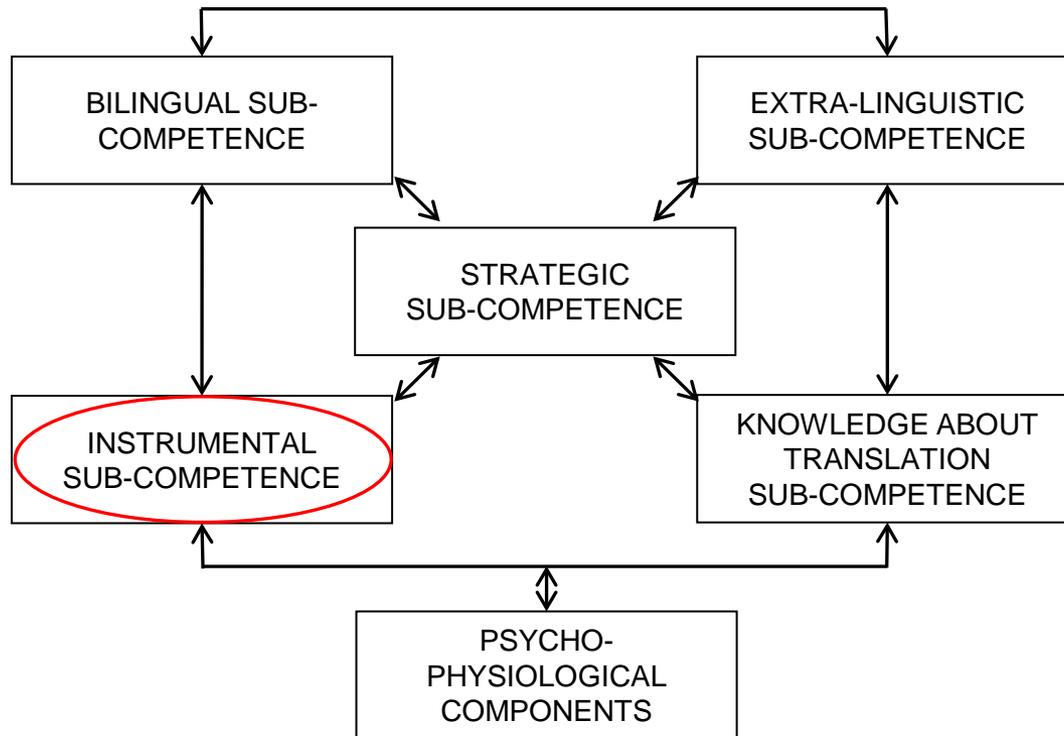

- general preparations (quotation, scheduling, etc.)
- **translation-specific preparations** (TM creation, **subject matter, register, and terminology research**, etc.)

translation process

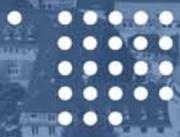

- text reception/analysis
 - **“on-the-fly“ research (linguistic and conceptual)**
 - translation
 - quality assurance (proofreading etc.)
- follow-up measures (file clean-up, delivery, etc.)

Situating the use of corpora within a translation competence model

PACTE's Model of Translation Competence (PACTE 2003)

Different approaches to corpus use in the translation classroom

- Corpus use for learning to translate
 - corpora are selected and controlled by the teacher to provide real-life examples and exercises
 - students learn to use corpora for their actual translation task but not to compile/evaluate them

- Learning corpus use to translate
 - corpus compilation and evaluation are the students' responsibility
 - holistic approach to corpus use for translating

Do-it-yourself (DIY) corpora

- corpora of texts compiled with the sole purpose of providing information (linguistic or conceptual) for completing a specific translation task
- also called disposable or ad-hoc corpora
- useful not only as a training resource, but also as a resource for professional translators

DIY corpora

possible sources for retrieving corpus texts

- **the client**
 - lecturer can act as client
 - “corpus use for learning to translate” approach
 - students do not acquire or improve their own documentation skills

- **specialist resources**
 - databases, academic articles, etc.
 - not always available for the required subject domains

- **the internet**
 - offers vast amount of information in multiple digital formats
 - most viable alternative for documenting translation tasks
 - requires specific research and QA strategies

DIY corpora

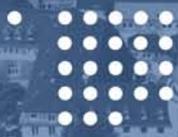

retrieving corpus texts from the internet

- determining the characteristics of the resource used for text research
 - raising students' awareness of the difference between Surface Web and Deep Web
 - universal search engines (e.g. Google, Yahoo!, Bing) vs vertical search engines specialising in a specific field or discipline (e.g. scirius.com for scientific and technical information)
 - ranking criteria for displaying search results (e.g. Google's *PageRank* algorithm)
- specific research techniques for narrowing down the potential results
 - search within a specific website or top-level domain (e.g. *site:.edu/ac.uk*)
 - search within specific file formats (e.g. *filetype:.pdf*)
- establishing quality criteria
 - possible evaluation criteria: authorship, publishing organisation, own judgement of corpus samples (e.g. analysing translated texts for instances of *translationese*)

Excursus: the Web as corpus

- Web is used as macro-corpus
- applying specific search criteria to narrow down the search results (see previous slide)
- Shifting focus from corpus design to search strategies and interpretation of the results
- no indication of the external boundaries or the internal subdivision of the “Web subcorpus“
- Search engines do not present results in a form suitable for linguistic analysis
- Web concordancer: e.g. WebCorp Live (<http://www.webcorp.org.uk/live/>)

Excursus: the Web as corpus

Corpus analysis software

- monolingual comparable corpora: e.g. WordSmith
(<http://www.lexically.net/wordsmith>)
- bilingual translation corpora: e.g. ParaConc
(<http://www.athel.com/para.html>)
 - texts can be prealigned with specific alignment tool (e.g. WinAlign)
 - ParaConc also offers alignment function
- texts must be converted to TXT format before analysis

Analysing a bilingual translation corpus

- looking for the terminological equivalent of “storage site”

ParaConc - [Parallel Concordance - [storage site]]

Text, Wordlist, text/html, UTF8 (Failed), 2001-03-22 (Server header)

7: CARBON DIOXIDE (CO₂) What is Carbon Dioxide? Carbon dioxide (CO₂) is a colourless, odourless, non-toxic gas that in its solid form is

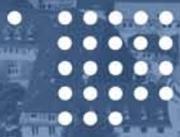

Some disadvantages of using special corpus-analysis software

- conversion of corpus files into txt format and file alignment/preparation for automatic alignment may be quite time consuming
- loss of formatting information (boldface, italics, etc.)
- loss of image information (no study of image-text interaction possible)
- focus on micro level, i.e. search words and their immediate linguistic context (no study of macro-level structures possible)

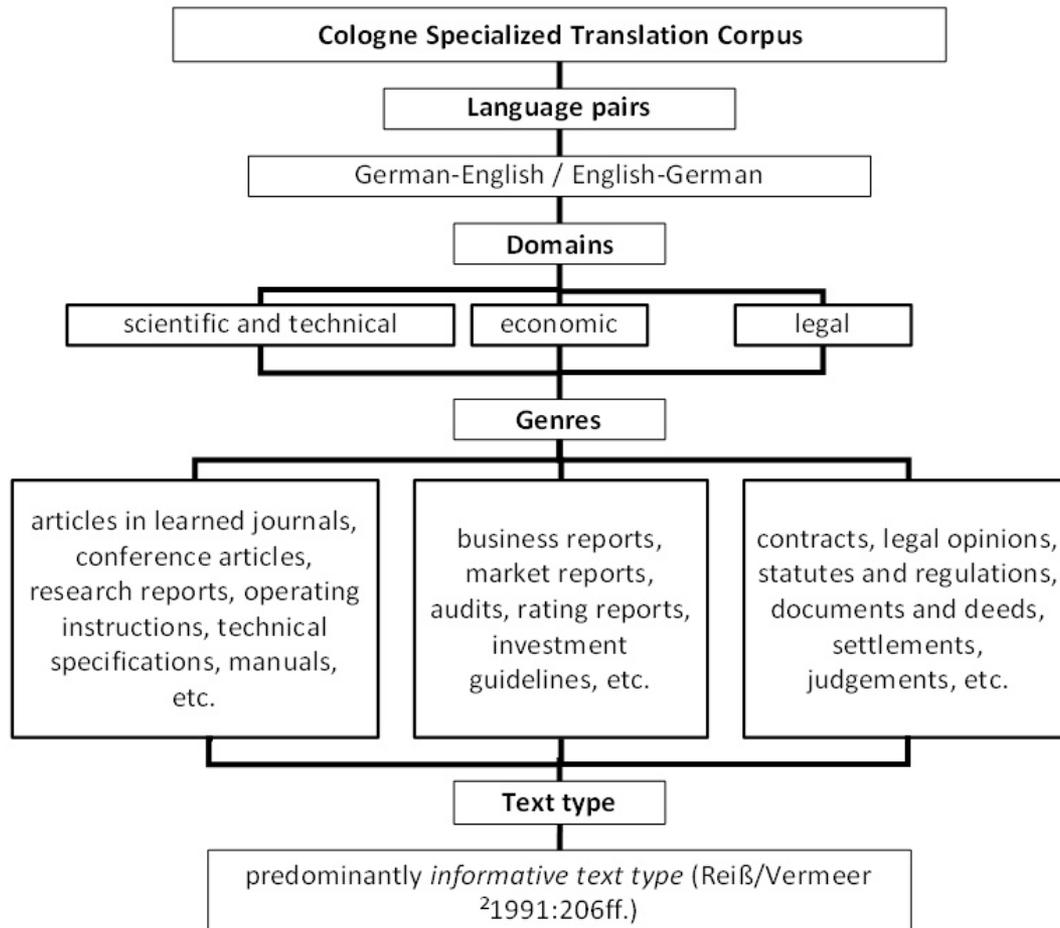

The Cologne Specialised Translation Corpus

- high-quality bilingual specialised translation corpus (English and German)
- expert communication in different domains and different genres
- used for translator training as well as for research projects (MA and PhD theses)
- Example of corpus-based PhD research: investigation of explicitation and implicitation in scientific and technical translation (language directions EN-DE and DE-EN, texts differ in degrees of technicality)
